Time: 3 Hrs	Answer All Questions	Max Marks: 100
-------------	----------------------	----------------

1	a) State and prove Varignon's Theorem.	05
	<p>b) Determine the components F_a and F_b of the 4-kN force along the oblique axes a and b. Determine the projections P_a and P_b of F onto the a- and b-axes.</p> 	07
	<p>c) At what angle θ must the 800-N force be applied in order that the resultant R of the two forces has a magnitude of 2000 N? For this condition, determine the angle β between R and the vertical.</p> 	08

-
- Diagram of a beam with a fixed support at O , a roller support at A , and a free end at C . A 1.4 kN upward force is applied at A , a $15 \text{ kN}\cdot\text{m}$ counter-clockwise moment is applied at B , and a 3 kN force at 30° is applied at C . Distances are 1.2 m (O to A), 1.8 m (A to B), and 1.8 m (B to C).

-
- A diagram showing a sphere in contact with two inclined planes. The left inclined plane makes an angle of 75° with the horizontal. The right inclined plane makes an angle of 30° with the horizontal. The point of contact with the left plane is labeled A , and the point of contact with the right plane is labeled B . The sphere is shaded gray.

-
- Diagram of a rectangular beam of length L and height h . The beam is divided into two sections: a left section of length $\frac{L}{4}$ and a right section of length $\frac{3L}{4}$. The left section is labeled A and the right section is labeled B . The mass of the beam is m .

3	a) Illustrate the various types of beams with a neat sketch.	06
	b) Determine the force and moment reactions at A for the cantilever beam subjected to the loading shown.	08
		
	<p>c) Each member of the truss is a uniform 8-m bar with a mass of 400 kg. Calculate the average tension or compression in each member due to the weights of the members as shown in figure</p> 	06
4	a) Determine the x- and y-coordinates of the centroid of the shaded area.	06
		
	b) State and prove parallel axis theorem.	06

- c) Determine the rectangular and polar radii of gyration of the shaded area about the axes shown.

08

- 5 a) What are the types of friction? Briefly explain them.

06

- b) The 50-kg wheel rolls on its hub up the circular incline under the action of the 12-kg cylinder attached to a cord around the rim. Determine the angle θ at which the wheel comes to rest, assuming that friction is sufficient to prevent slippage. What is the minimum coefficient of static friction which will permit this position to be reached with no slipping?

06

- c) The 100-kg industrial door with mass center at G is being positioned for repair by insertion of the 5° wedge under corner B. Horizontal movement is prevented by the small ledge at corner A. If the coefficients of static friction at both the top and bottom wedge surfaces are 0.60, determine the force P required to lift the door at B.

08
